

Cholest EZE

It is estimated that 100 million people in industrialized nations have Cholesterol levels exceeding what is considered to be safe, or acceptable. While Cholesterol has never caused Heart Disease, it is well established that excess Serum Cholesterol can be a risk factor in Heart Disease once the damage to arterial integrity has taken place.

Drugs used to control this condition, called Statin drugs, are effective for some people, but come at a risky price. Firstly, they only work for a small percentage of the population. Secondly, routine blood tests are required when taking these drugs due to their potential harm to Liver function.

There are natural factors, which can assist the Liver in regulating all of the Lipids within the body. Since the body manufactures far more Cholesterol and is consumed in the diet, and since Cholesterol is absolutely essential to human health, we want to control the level of cholesterol, not destroy its production.

By nourishing the Liver and providing dietary co-factors that the body can use to effectively eliminate excess Cholesterol, millions of people have been able to normalize their Cholesterol without the fear of potentially harmful drug therapy.

We suggest that if you have a present problem with elevated Cholesterol (above 220) you take 3 capsules of Cholest Eze twice per day for the first 90 days, after which you should have your total Cholesterol checked again.

If it has returned to a more normal level, slowly reduce the amount of Cholest Eze to a maintenance level that's right for your body. If your total Cholesterol is above 260, we suggest using 1 tablespoon of Lecithin granules twice per day, in addition to the 6 capsules of Cholest Eze for the first 90 days.
