

Phoenix Nutritionals Products Earn NSF GMP Certification

As a biochemist and Clinical Nutritionist, I have always insisted that my formulations be of the highest possible standard. Until recently these standards were at the discretion of each manufacturer. That has changed with the creation of the Good Manufacturing Practices Certification, issued by NSF International.

NSF International is an independent testing organization dedicated to ensuring optimal quality control of the dietary supplement industry. By having our supplements NSF Certified, our consumers are ensured that they are manufactured in the absolute highest standards of excellence. NSF Certification verifies that the contents of the supplements actually match what is printed on the label. Further, they ensure that there are no contaminants or ingredients present in the supplement that are not openly disclosed on the label.

When a manufacturer receives GMP (Good Manufacturing Practices) Certification from NSF International you are guaranteed of both the quality and potency of the supplements manufactured by them.

NSF International is accredited by the American National Standards Institute, The International Accreditation Service and the Occupational and Safety Health Administration.

I am pleased to announce that all the formulas I make for Phoenix Nutritionals are now manufactured in NSF International GMP registered facilities. Our NSF GMP Certification is another example of our dedication to providing the best possible products. By investing in the necessary procedures and equipment to establish the safety and effectiveness of the ingredients in our products, our consumers have the comfort that comes from knowing we are manufacturing at the highest possible standards.

During the industry transition to these new standards, which include raw material testing, finished product testing and site inspections, at many levels, there may be some delay in processing raw materials. This may temporarily slow down the availability of certain raw materials and hence the products made from them. We feel that this situation is only temporary, but may continue for several more months. If you use one or more of our products you may wish to order a bit ahead of need to ensure you will have product if there is a delay.
